

Agree on the problems first rather than proposing a solution.

Deprecation:
Shutting down existing services with graceful period.

Do we have the knowledge to start using modern pipelines today? If not, we should skip version control for now.

Suggest to keep everything as it is. No action is an action.

Containerize

Or maybe start with it, and train the team

Make a comparison table of possible solutions.

Is there any dependencies between the build tools and the operating system? Would we need to update the build tools again if we change the operating system?

Introduce corporate policy enforced through MDM profile.

Seems like both the build tools and the version control are somewhat dependent on the Operating System, so maybe we should start there?
